Determining the difference between levels of expression of a number genes, useful for diagnosing and treating disorders associated with or cartilage formation or resorption such as osteoporosis and bone of

Page 190-192; 197pp; English

The invention discloses a method for determining the difference between CC the levels of expression of a number of, at least 500 genes, during bone CC or cartilage formation. The method comprises determining levels of RNA CC from the genes to obtain levels of expression and comparing these to a CC essential process in embryonic development and plays a critical role in CC many diseases and conditions in humans. Two genes found to be regulated CC 1 (CLF-1 or CLRP-1), which is specifically regulated during bone and cartilage formation are the cytokine receptor-like factor C (CLF-1 or CLRP-1), which is specifically regulated during mesenchymal CC computer program for analysing levels of expression of a number of genes (C compositions comprising a number of antagonists or agonists of genes, CC compositions comprising whether a subject has, or is likely to CC develop, a disease related to bone or cartilage formation or resorption, for identifying a compound for treating, modulating or stimulating at treatment intended to bone or cartilage formation possibly acting as a cadherin or CD68 agonist or a cytokine antagonist. The methods and compositions are useful for costeoblastoma, osteopertrusis, osteogenesis imperfecta, osteoporosis, osteopenia, osteopertrusis, osteopenia, periodontal disease,

The methods are useful for classifying a breast cancer patient according to prognosis and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 1081; 226pp; English

The present sequence encodes a human CLF-1 protein. The specification CC describes a complex comprising a NNT-1 protein and a CLF-1 and/or CC scNTFRAlpha protein. The NNT-1/CLF-1 complex is used to modulate activity CC of the scNTFRAlpha/gpl30/LIFRbeta receptor complex, or to induce CC phosphorylation of the tyrosine of gpl30 and LIFRbeta, particularly where CC cells expressing the receptor complex are in the central or peripheral CC nervous system, in neurons implicated in neuro-muscular function or in CC skeletal muscle. The complex or antibodies are also used to decrease the CC survival, growth or proliferation of tumour cells or to facilitate the CC proliferation and/or inhibit differentiation of cells stocks. The complex CC is also used to modulate activity of the gpl30/LIFRbeta receptor or cells CC expressing that receptor, particularly those cells implicated in the CC immune, haematopoietic, nervous or reproductive system, the liver or CC immune, haematopoietic, nervous or reproductive system, the liver or CC exception and Huntington's disease, to repair or regenerate nervous or parkinson's and Huntington's disease, to repair or regenerate nervous or parkinson's show the disease, to repair or regenerate nervous or improve fertility, particularly to avoid endometriosis and/or assist blastocyst implantation, thrombosis, or retinal disease, particular

It was isolated from a human cDNA library and deposited under accession number ATCC 98688. The U4 polymucleotide and protein are predicted to have following biological activities- cytokine, cell proliferation/differentiation, immune stimulating or suppressing and haematopoiesis regulating. The polymucleotide and the protein can be used to treat immune disorders and deficiencies, autoimmune disorders, allergies, cancer, myeloid or lymphoid cell deficiencies and platelet disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1789
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated nucleic acids and their encoded PRO proteins. The PRO polypeptides are useful in diagnosing and treating a condition that is responsive to the PRO polypeptide, e.g., in the treatment of sports-related joint problems, articular cartilage defects, osteoarthritis, rheumatoid arthritis and cancer. The PRO polypeptides are also useful in identifying agonists/antagonists of the PRO polypeptide. The nucleic acid is useful as hybridisation probe, in chromosome and gene mapping, and in the generation of anti-sense RNA and DNA. The present sequence represent a human secreted/transmembrane PRO polypeptide cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polypeptide, for recombinantly producing the PRO polypeptide and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1789 BP; 358 A; 624 C; 529 G; 278 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of cDNA clone DNA38113 (ATCC 209530) coding for human PRO288 (UNQ288) (see AAY06479). The clone was isolated from a foetal lung library. Amplification of DNA38113 in chromosome 19 occurs in various lung and colon tumours and cell lines, suggesting a significant role in tumour formation and growth. Antagonists (e.g. antibodies) directed against PRO228 are expected to have utility in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour cells. Such amplification is expected to be associated with overexpression of the gene product and to contribute to tumorigenesis. The encoded proteins (see AAX06477-90) may be useful targets for the diagnosis and/or treatment (including prevention) of certain cancers, and may act as predictors of the

                                                                                                            New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources
                                                                                                                                                                                                                                                                                                                                                                                                          Baker KP, Botstein D,

New transmembrane polypeptides and polynucleotides useful for chromosome identification, tissue typing, gene therapy, in chromosome and gene mapping, or as molecular weight markers.

Claim 2; Fig 13; 172pp; English.

CC transmembrane polypeptide (designated as PRO proteins). 15 PRO
CC polypeptides and their encoding polymucleotides are disclosed. Also
CC polypeptides and their encoding polymucleotides are disclosed. Also
CC included are a vector comprising the PRO nucleic acid, a host cell
CC comprising the vector, a process for producing a PRO polypeptide (by
CC culturing the host cell under conditions for the expression of the PRO
CC polypeptide, and recovering the PRO polypeptide from the cell culture, an
CC isolated polypeptide having at least 80% amino acid sequence identity to
CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a
CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a
CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a
CC the PRO polypeptides, a chimaerating sense and antibody which specifically binds
CC to PRO. The PRO nucleotide sequences are useful as hybridisation probes,
CC in chromosome and gene mapping, in generating sense and antisense RNA or
CC NA, in generating transgenic or knock-out animals which can be used in
CC the evelopment and screening of therapeutically useful reagents, and in
CC gene therapy. The polypeptides may be used as molecular weight markers
CC for protein electrophoresis purposes. The PRO polypeptides and nucleic
CC colds may also be used for chromosome identification, and tissue typing.
CC RRO241 (identified as Chordin) is a candidate gene for Cornelia de Lange
CC syndrome. Other PRO proteins are variously implicated in immune
CC disorders, inflammatory disease, organ failure, atherosclerosis, cardiac
CC injury, infertility, birth defects, premature aging, cardiac injury,
CC RRO rorderin protein

The methods compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This sequence encodes a novel human secreted PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated PRO polypeptide and encoding nucleic acids, useful for the diagnosis and treatment of disorders such as inflammatory disease, atherosclerosis, cardiac injury, infertility, AIDS, cancer and diabetic

```

This invention relates to a nucleotide sequence encoding an isolated secreted and/or transmembrane protein. The nucleotide sequences of the invention may have antiinflammatory, antiarterioscilerotic, cardiant, anti-infertility, anti-HIV, cytostatic and antidiabetic activities and may be used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atheroscilerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioteactors. Both are useful in tissue typing. The present sequence represents a nucleic acid sequence of the invention

Homo sapiens

New isolated PRO polypeptide and encoding nucleic acids, useful for the diagnosis and treatment of disorders such as inflammatory disease, atherosclerosis, cardiac injury, infertility, AIDS, cancer and diabetic complications.

Claim 2; Fig 13; 171pp; English.

CC The invention relates to an isolated PRO polypeptide having at least 80% CC amino acid sequence identity to and scoring at least 80% positives when CC compared to any of 15 fully defined sequences of 235-954 amino acids, CC given in the specification. Also included are: (1) an isolated PRO CC nucleic acid having at least 80% nucleic acid sequence identity to a CC nucleotide sequence that encodes PRO or its extracellular domain, and CC comprising any of 15 fully defined nucleotide sequences of 957-3441 bp, CC 209526, 209508, 209524, 209528, 209524 and 209528, 209527, 209529, 209527, 209570, 209518, 209521 and 209619; (2) a vector CC comprising the PRO nucleic acid; (3) a host cell comprising the vector; CC (4) producing PRO polypeptides, comprising culturing the cell for expression of the PRO polypeptides, comprising culturing the PRO polypeptide and recovering the PRO polypeptide from the cell culture; (5) a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence; and (6) an anti-PRP antibody.
